SAMPLE DOSSIER · PROVENANCE AND 6-AXIS AUDIT

Port closure: what is established and what is not

A desk editor has an hour to say what is known about a port closure. Fourteen reports say it in different words. Three of them are origins.

SAMPLE DATA: INVENTED TO SHOW THE FORMAT. NOT A REAL RECORD.

Harbour authority closes main container port, shippers say

Reports agree the port is shut to inbound vessels. They differ on why, and on whether secondary berths are affected.

THE QUESTION THE RECORD WAS ASKED

What can the desk print now, and what must it mark as unconfirmed?

REPORTS INGESTED

of the fourteen

PRIMARY DOCUMENTS

1

a posted notice

CONTESTED AXES

2

where and why

The headline arrives with fourteen versions. The desk starts from the claim, not the wording: the port is closed, and someone says why.

What the dossier holds: Claim ledger, nine claims; Six sources with roles and scores; Six-axis audit, two contested; Impact matrix, nine pillars; Edit history, two entries.

§ 02 SOURCES INGESTED

Who said it first, and who repeated it.

Six of the fourteen are shown here. One is the notice itself, two report on their own, and the rest repeat. Counting origins rather than reports moves the desk from fourteen voices to three.

Scores are the sample's own and show how a reading is displayed. Role counts matter more than the number: three origins stand behind fourteen reports.

Who, what, when, where, why and how.

Who, what and when hold. Where and why do not. The two origins give different reasons, so the audit marks the axis as contested instead of picking a side.

Who

The harbour authority, per its own notice.

86

CONFIDENCE

What

Port closed to inbound vessels.

90

CONFIDENCE

When

From 06:00 local, no end time stated.

84

CONFIDENCE

Where

Main container terminal. Secondary berths unclear.

CONTESTED**58**

CONFIDENCE

Why

Weather, or an inspection. The two origins differ.

CONTESTED**38**

CONFIDENCE

How

Notice posted, then enforced by traffic control.

72

CONFIDENCE

A contested axis is marked, not averaged away. The audit describes what the sources say and where they differ. It does not rule on which is right.

Where the claim, if it holds, would reach.

The record does not forecast. It lists where the claim, if it holds, touches the nine pillars. Supply chain and economic readings are highest, and the desk can see which findings rest on the unconfirmed axes.

Readings show exposure if the claim were true. They are not forecasts and carry no recommendation.

What was fixed, and when.

The desk seals a dossier at the time of publishing. The claim ledger, the sources and the two recorded edits are fixed as they stood, so a later correction is a new entry, not a rewrite.

A full dossier for this record holds:

- | | |
|----|-----------------------------------|
| 01 | Claim ledger, nine claims |
| 02 | Six sources with roles and scores |
| 03 | Six-axis audit, two contested |
| 04 | Impact matrix, nine pillars |
| 05 | Edit history, two entries |

This sample prints the sources, the audit and the impact matrix. The claim ledger and the edit history are listed but not reproduced.

SEALED

14 SEP 2026 · 12:05 local (sample)

STATUS

Sample. Nothing in this file was sealed or signed.

The desk files the dossier with the story and links it from the corrections log. A real dossier fixes its content and time, so a later correction is a new entry and not a rewrite.

End of the sample. Prepared 1 October 2026 (2026-10-01). The people, outlets, figures and reference numbers here are invented. To see how a record is built, open the live demo at 7analytica.com/demo.
